

Project Explanation: Intelligent Multi-Modal Storage System This document summarizes the project's backend and frontend functionalities, architecture, and code explanation, based on the user's GitHub repository. 1. Overview: A Flask-based backend manages user authentication, per-user storage isolation, media upload, JSON classification, and retrieval. The frontend provides a dashboard for uploading and viewing stored content. 2. Backend Highlights: - User registration & login using hashed passwords. - Session-based authentication and protected endpoints. - Automatic folder creation for each user under storage/. - Unified upload endpoint for images, videos, and JSON structured data. - JSON classification into SQL or NoSQL based on nested structures. - Retrieval routes for file listing and dashboard statistics. - File-serving endpoint for authorized users. 3. Frontend Highlights: - Dashboard with user details, stats, upload forms. - Fetch API calls using credentials for secure communication. - File viewer, retrieval, and dynamic UI updates.
